

THE POWER OF
REDARC

HANDBRAKE ALARM RANGE EXPANDED

UPDATED HANDBRAKE ALARM RELEASED

REDARC has announced the updated release of the market leading Hand Brake Alarm (HBA1224) which previously included a fly lead loom and now features an option with a connectorised loom (HBA1224-003). The mating connector (HBAKIT-001) can be purchased separately, or with a connectorised HBA in a kit (HBA1224-003-KIT1).

Reduce the risk of vehicles being accidentally left unattended without the handbrake on, and ensure you are compliant with typical mine site and transport operational requirements with an Australian made and proven Hand Brake Alarm.

All of the trusted and proven functionality of the REDARC Hand Brake Alarm is retained with this release, including a redesign to reduce installation time and complexity into a range of vehicle types and platforms. This makes it perfect for integrating into wiring harnesses for fleet installations, or for applications where crimping is preferable to soldering.

The installation instructions of the mating connector can be found in the updated manual with every HBA unit, or via the QR code on the HBAKIT-001.
